

Static mixer

The static mixer for fischer injection mortars

The secure and approval-compliant installation of injection systems is only guaranteed through the use of optimally matched system components such as the static mixers. In the case of fixation systems with injection mortar, the two components are only mixed and activated during extrusion by the mixing spiral in the static mixer. The static mixer guarantees a consistent mixing of the mortar components and thus enables the safety-relevant application of the fischer injection mortar. The static mixer closes after the cartridge has been used. A new static mixer is screwed on before reuse.

Product Description

Advantages

- The fischer static mixers are ideally adapted to the fischer injection mortars.
- The static mixer provides for a homogeneous mixing of the mortar components and thus allows for a secure application of the fischer injection mortars.
